Note: **A table of Laplace Transforms is given at the end of the exam**.

1 $\left(25\text{ **pts.**}\right)$ Use Laplace Transforms to solve

$$y'' + 10y' + 9y = 8t \quad y(0) = -1 \ \ y'(0) = 1$$

Solution: We take the Laplace Transform of both sides to get

$$\mathcal{L}\{y''\} + 10\mathcal{L}\{y'\} + 9\mathcal{L}\{y\} = \mathcal{L}\{8t\} = \frac{8}{s^2}$$

or letting $\mathcal{L}\{y\} = Y(s)$

$$s^2Y - sy(0) - y'(0) + 10(sY - y(0)) + 9Y = \frac{8}{s^2}$$

$\Rightarrow$

$$(s^2 + 10s + 9)Y = \frac{8}{s^2} - s + 1 - 10$$

$$Y = \frac{8}{s^2(s+9)(s+1)} - \frac{s+9}{(s+9)(s+1)} = \frac{8 - s^3 - 9s^2}{s^2(s+9)(s+1)}$$

We have to decompose this last fraction into partial fractions.

$$\frac{8 - s^3 - 9s^2}{s^2(s+9)(s+1)} = \frac{A}{s} + \frac{B}{s^2} + \frac{C}{s+9} + \frac{D}{s+1}$$

Multiplying by s^2 and setting $s = 0$ gives

$$\frac{8}{9} = B$$

Multiplying by $s + 9$ and setting $s = -9$ gives

$$\frac{8 - 81(-9) - 9(81)}{81(-8)} = \frac{8}{81(-8)} = -\frac{1}{81} = C$$

Multiplying by $s + 1$ and setting $s = -1$ gives

$$\frac{8 + 1 - 9}{8} = 0 = D$$

Thus we now have

$$\frac{8 - s^3 - 9s^2}{s^2(s+9)(s+1)} = \frac{A}{s} + \frac{\frac{8}{9}}{s^2} + \frac{-\frac{1}{81}}{s+9}$$

Let $s = 1$. Then

$$\frac{8 - 1 - 9}{(10)(2)} = A + \frac{8}{9} - \frac{1}{810}$$

$$\frac{-2}{20} = A + \frac{720 - 1}{810} = A + \frac{719}{810}$$

$$A = -\frac{1}{10} - \frac{719}{810} = \frac{-81 - 719}{810} = -\frac{800}{810} = -\frac{80}{81}$$

Thus

$$Y(s) = \frac{8 - s^3 - 9s^2}{s^2(s+9)(s+1)} = -\frac{1}{81(s+9)} - \frac{80}{81s} + \frac{8}{9s^2}$$

Hence

$$y(t) = -\frac{1}{81}e^{-9t} - \frac{80}{81} + \frac{8}{9}t$$

2

$$y'' + 10y' + 9y = 8t$$
$$y(0) = -1$$
$$y'(0) = 1$$

,, Exact solution is: $\{\frac{8}{9}t - \frac{1}{81}e^{-9t} - \frac{80}{81}\}$

2a (**15 pts**.)   Use the definition of the Laplace transform to find $\mathcal{L}\{f(t)\}$ where

$$f(t) = \begin{cases} 6 & 0 \le t \le 6 \\ \\ t & t \ge 6 \end{cases}$$

Solution:

$$\mathcal{L}\{f(t)\} = \int_0^\infty e^{-st} f(t)dt = \int_0^6 6e^{-st}dt + \int_6^\infty te^{-st}dt$$

$$= -\frac{6}{s}e^{-st}\big|_0^6 + \lim_{R\to\infty}\left[\int_6^R te^{-st}dt\right] \quad \text{let } u = t \quad dv = e^{-st}dt \Rightarrow v = -\frac{e^{-st}}{s}$$

$$= \frac{6}{s}[1 - e^{-6s}] + \lim_{R\to\infty}\left[-t\frac{e^{-st}}{s}\big|_6^R + \frac{1}{s}\int_6^R e^{-st}dt\right]$$

$$= \frac{6}{s}[1 - e^{-6s}] + \lim_{R\to\infty}\left[-R\frac{e^{-sR}}{s} + \frac{6e^{-6s}}{s}\right] + \left(-\frac{1}{s^2}\right)\lim_{R\to\infty}[e^{-Rs} - e^{-6s}] \quad s > 0$$

$$= \frac{6}{s}[1 - e^{-6s}] + \frac{6e^{-6s}}{s} + \frac{e^{-6s}}{s^2} = \frac{6}{s} + \frac{e^{-6s}}{s^2} \quad s > 0$$

2b (**10 pts.**)   Find

$$\mathcal{L}^{-1}\left\{\frac{1 + 3s}{s^2 - 8s + 21}\right\}$$

Solution:

$$\frac{1 + 3s}{s^2 - 8s + 21} = \frac{1 + 3s}{(s - 4)^2 + 5}$$

$$= \frac{1 + 3(s - 4) + 12}{(s - 4)^2 + 5}$$

$$= \frac{13}{(s - 4)^2 + 5} + 3\frac{s - 4}{(s - 4)^2 + 5}$$

$$= \frac{13}{(s - 4)^2 + (\sqrt{5})^2} + 3\frac{s - 4}{(s - 4)^2 + (\sqrt{5})^2}$$

$$= \left(\frac{1}{\sqrt{5}}\right)\frac{13\sqrt{5}}{(s - 4)^2 + (\sqrt{5})^2} + 3\frac{(s - 4)}{(s - 4)^2 + (\sqrt{5})^2}$$

Thus

$$\mathcal{L}^{-1}\left\{\frac{1+3s}{s^2-8s+21}\right\} = \left(\frac{13}{\sqrt{5}}\right)\mathcal{L}^{-1}\left\{\frac{\sqrt{5}}{(s-4)^2+\left(\sqrt{5}\right)^2}\right\} + 3\mathcal{L}^{-1}\left\{\frac{(s-4)}{(s-4)^2+\left(\sqrt{5}\right)^2}\right\}$$

$$= \left(\frac{13}{\sqrt{5}}\right)e^{4t}\sin\sqrt{5}\,t + 3e^{4t}\cos\sqrt{5}\,t$$

3 $\left(25\text{ pts.}\right)$ Find the first <u>six</u> non-zero terms in the series solution near $x = 0$ of the equation

$$y'' + xy = 0$$

Be sure to give the recurrence relation. Indicate the two linearly independent solutions and give the first *six* nonzero terms of the solution.

Solution:

$$y = \sum_{n=0}^{\infty} a_n x^n$$

$$y' = \sum_{n=1}^{\infty} a_n n x^{n-1}$$

$$y'' = \sum_{n=2}^{\infty} a_n n(n-1)x^{n-2}$$

Substituting into the DE we have

$$\sum_{n=2}^{\infty} a_n n(n-1)x^{n-2} + \sum_{n=0}^{\infty} a_n x^{n+1} = 0$$

We shift the second sum. Let $k - 2 = n + 1$ so that $n = k - 3$ and since $n = 0 \Rightarrow k = 3$

$$\sum_{n=2}^{\infty} a_n n(n-1)x^{n-2} + \sum_{k=3}^{\infty} a_{k-3} x^{k-2} = 0$$

We replace n and k by m to get

$$a_2(2)(1) + \sum_{m=3}^{\infty} [a_m(m)(m-1) + a_{m-3}]x^{m-2} = 0$$

Thus

$$a_2 = 0$$

$$a_m = -\frac{a_{m-3}}{(m)(m-1)} \quad m = 3,4,5,\ldots$$

$$a_3 = -\frac{a_0}{3(2)}$$

$$a_4 = -\frac{a_1}{4(3)}$$

$$a_5 = 0$$

$$a_6 = -\frac{a_3}{6(5)} = \frac{a_0}{6(5)(3)(2)}$$

$$a_7 = -\frac{a_4}{7(6)} = \frac{a_1}{7(6)(4)(3)}$$

$$a_8 = 0$$

Hence

$$y = \sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \cdots$$

$$= a_0 \left[1 - \frac{1}{3(2)} x^3 + \frac{1}{6(5)(3)(2)} x^6 + \cdots \right] + a_1 \left[x - \frac{1}{4(3)} x^4 + \frac{1}{7(6)(4)(3)} x^7 + \cdots \right]$$

4 $\left(\textbf{25 pts.}\right)$ Find the eigenvalues and eigenfunctions for

$$y'' + \lambda y = 0; \quad y(0) = 0, \quad y(3\pi) = 0$$

Be sure to consider all values of λ.

Solution: We consider three cases.

1. $\lambda < 0$. Let $\lambda = -\alpha^2$ where $\alpha \neq 0$ so the DE becomes $y'' - \alpha^2 y = 0$ and $y = c_1 e^{\alpha x} + c_2 e^{-\alpha x}$. Then

$$y(0) = c_1 + c_2 = 0$$

$$y(3\pi) = c_1 e^{3\alpha\pi} + c_2 e^{-3\alpha\pi} = 0$$

Since the first equation implies $c_1 = -c_2$ the second equation implies that

$$c_1 (e^{3\alpha\pi} - e^{-3\alpha\pi}) = 0$$

and we see that $c_1 = c_2 = 0$. Thus the only solution for $\lambda < 0$ is $y = 0$.

2. $\lambda = 0$ Then $y = c_1 x + c_2$. $y(0) = c_2 = 0$. $y(3\pi) = 3c_1\pi = 0$, so $c_1 = 0$. Thus the only solution for $\lambda = 0$ is $y = 0$.

3. $\lambda > 0$. Let $\lambda = \beta^2$ where $\beta \neq 0$ so the DE becomes $y'' + \beta^2 y = 0$. The solution is $y = c_1 \sin\beta x + c_2 \cos\beta x$. Since $y(0) = c_2 = 0$, we see that $y = c_1 \sin\beta x$

$$y(3\pi) = c_1 \sin 3\pi\beta = 0$$

$\Rightarrow 3\pi\beta = n\pi, \quad n = 1, 2, 3, \ldots$ and

$$\beta = \frac{n}{3} \quad n = 1, 2, 3, \ldots$$

Hence the eigenvalues are $\lambda = \beta^2 = \frac{n^2}{9}$, $n = 1, 2, 3, \ldots$ and the eigenfunctions are

$$y_n(x) = a_n \sin\left(\frac{nx}{3}\right) \quad n = 1, 2, 3, \ldots$$

Table of Laplace Transforms

$f(t)$	$F(s) = \mathcal{L}\{f\}(s)$
