1 [20 pts.] Find the volume of the prism whose base is the triangle in the x, y -plane bounded by the x -axis, and the lines y = x and x = 1 and whose top lies in the plane z = 3 - x - y. Be sure to sketch the triangle in the x, y -plane.

x

Thus

$$V = \iint_{\text{Triangle}} (3 - x - y) dA = \int_0^1 \int_0^x (3 - x - y) dy dx = \int_0^1 \left[ 3y - xy - \frac{y^2}{2} \right]_{y=0}^{y=x} dx$$
$$= \int_0^1 \left[ 3x - \frac{3}{2} x^2 \right] dx = \left[ \frac{3x^2}{2} - \frac{x^3}{2} \right]_0^1 = 1$$

or

$$V = \iint_{\text{Triangle}} (3 - x - y) dA = \int_{0}^{1} \int_{y}^{1} (3 - x - y) dx dy = \int_{0}^{1} \left[ 3x - \frac{x^{2}}{2} - xy \right]_{x=y}^{x=1} dy$$

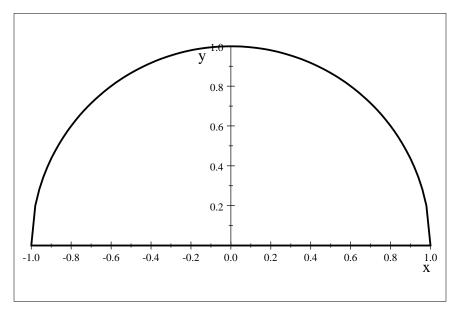

$$= \int_{0}^{1} \left[ 3 - \frac{1}{2} - y - 3y + \frac{y^{2}}{2} + y^{2} \right] dy = \int_{0}^{1} \left[ \frac{5}{2} - 4y + \frac{3y^{2}}{2} \right] dy = \left[ \frac{5y}{2} - 2y^{2} + \frac{y^{3}}{2} \right]_{0}^{1} = 1$$

**2 a** [20 **pts**.] Evaluate the iterated integral

$$\int_{-1}^{1} \int_{0}^{\sqrt{1-x^2}} x^2 (x^2 + y^2)^{\frac{1}{2}} dy dx$$

Be sure to sketch the region of integration in the x, y -plane.

Solution: y goes from 0 to  $\sqrt{1-x^2}$ . This means it goes from 0 to the circle  $x^2+y^2=1$ . x goes from -1 to 1. Thus the region of integration is the upper half of the unit circle.  $\sqrt{1-x^2}$ 

To evaluate the integral we switch to polar coordinates. Then

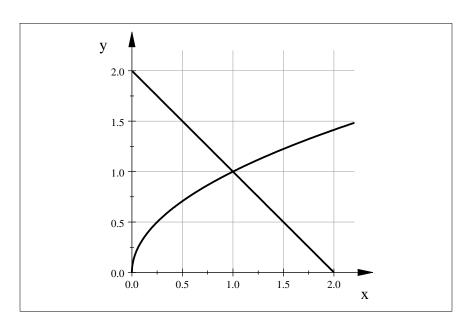

$$\int_{-1}^{1} \int_{0}^{\sqrt{1-x^2}} x^2 (x^2 + y^2)^{\frac{1}{2}} dy dx = \int_{0}^{\pi} \int_{0}^{1} (r^2 \cos^2 \theta) r(r) dr d\theta$$
$$= \int_{0}^{\pi} \int_{0}^{1} r^4 \cos^2 \theta d\theta = \frac{1}{5} \int_{0}^{\pi} \cos^2 \theta d\theta$$
$$= \frac{1}{5} \left[ \frac{1}{2} \cos \theta \sin \theta + \frac{1}{2} \theta \right]_{0}^{\pi} = \frac{\pi}{10}$$

 $\mathbf{2} \mathbf{b} \begin{bmatrix} 20 \mathbf{pts}. \end{bmatrix}$  Sketch the region of integration and change the order of integration for the integral

$$\int_0^1 \int_{y^2}^{2-y} f(x,y) dx dy$$

Solution: x goes from the parabola  $x = y^2$  to the line x = 2 - y or y = 2 - x. The region of integration is shown below

$$x = y^2$$

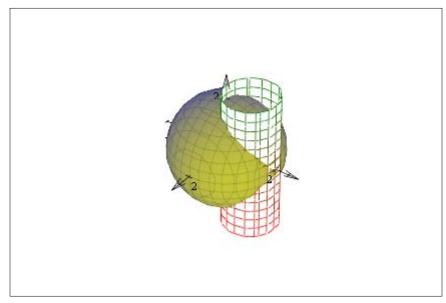

The two curves intersect when  $(2-x)^2 = x$  or when  $x^2 - 5x + 4 = 0$ . That is when (x-4)(x-1) = 0. This gives x = 1 and x = 4. However, we reject x = 4, since it is out of the range of the region. Thus the point of intersection is (1,1). Two integrals are needed to do the y integration first. Thus we have

$$\int_{0}^{1} \int_{y^{2}}^{2-y} f(x,y) dx dy = \int_{0}^{1} \int_{0}^{\sqrt{x}} f(x,y) dy dx + \int_{1}^{2} \int_{0}^{2-x} f(x,y) dy dx$$

**3** [20 **pts**.] Let *V* be the volume cut out of the sphere  $x^2 + y^2 + z^2 = 4$  by the cylinder  $x^2 + y^2 = 2y$ . Give a triple integral expression in **cylindrical** coordinates for the volume of *V*. Sketch *V*. Do not evaluate the integral you give.

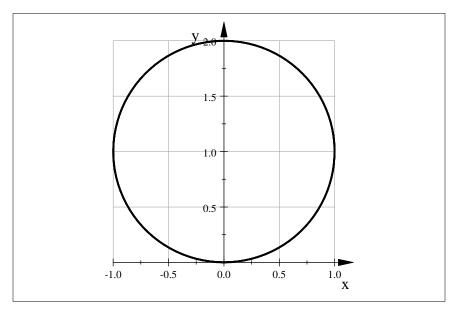

Solution: The region V is shown below. The sphere and the cylinder were plotted using Plot 3D, Implicit.

$$x^2 + y^2 + z^2 = 4$$

The graph of the cylinder in polar coordinates in the x,y –plane is given by  $r^2 = 2r\sin\theta$  or  $r = 2\sin\theta$ . Graphing this in polar yields

 $2\sin\theta$ 

Thus the region of integration in the x,y-plane is over the circle of radius 2 centered at (0,1). If we find the volume in the first octant and then double it, then z goes from the x,y-plane to the sphere. The equation of the sphere in cylindrical coordinates is  $z^2 = \sqrt{4 - x^2 - y^2} = \sqrt{4 - r^2}$ . Therefore

$$V = 2 \int_0^{\pi} \int_0^{2\sin\theta} \int_0^{\sqrt{4-r^2}} r dz dr d\theta$$

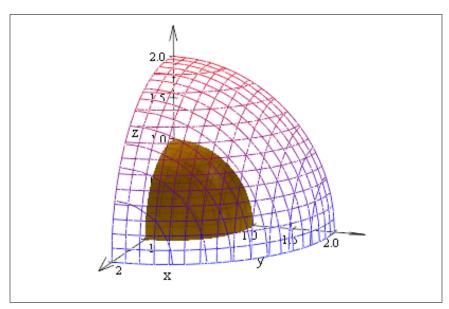

**4** [20 **pts**.] Give an integral expression in **spherical** coordinates for

$$\iiint\limits_{V} xe^{(x^2+y^2+z^2)^2} dV$$

where V is the solid that lies between the spheres  $x^2 + y^2 + z^2 = 1$  and  $x^2 + y^2 + z^2 = 4$  in the first octant. Do not evaluate this expression.

Solution: The two surfaces have radii of 1 and 2. Thus their equations are  $\rho = 1$  and  $\rho = 2$ . They are shown below. Plot 3D, Implicit was used.

$$x^2 + y^2 + z^2 = 1$$

Since we are in the first octant 
$$\theta$$
 and  $\phi$  both go from 0 to  $\frac{\pi}{2}$ . Therefore, since  $\rho^2 = x^2 + y^2 + z^2$ 

$$\iiint_V x e^{(x^2 + y^2 + z^2)^2} dV = \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \int_1^2 \rho \cos \theta \sin \phi e^{(\rho^2)^2} \rho^2 \sin \phi d\rho d\phi d\theta = \int_0^{\frac{\pi}{2}} \int_0^{\frac{\pi}{2}} \int_1^2 \rho \cos \theta \sin \phi e^{\rho^4} \rho^2 \sin \phi d\rho d\phi d\theta$$

## **Table of Integrals**

$$\int \sin^2 x dx = -\frac{1}{2} \cos x \sin x + \frac{1}{2} x + C$$

$$\int \cos^2 x dx = \frac{1}{2} \cos x \sin x + \frac{1}{2} x + C$$

$$\int \sin^3 x dx = -\frac{1}{3} \sin^2 x \cos x - \frac{2}{3} \cos x + C$$

$$\int \cos^3 x dx = \frac{1}{3} \cos^2 x \sin x + \frac{2}{3} \sin x + C$$
